Product Description

The TDSW0602T is a HaRP™ technology-enhanced reflective SPDT RF switch die that supports a wide frequency range from 9 kHz to 60 GHz. It delivers low insertion loss, fast switching time and high isolation in the operating temperature of –55°C to +125°C. It is ideal for applications that require extended temperature support within this range, such as harsh industrial applications. At 50 GHz, the TDSW0602T exhibits 1.9 dB insertion loss and 37 dB isolation. No blocking capacitors are required if dc voltage is not present on the RF ports.

The TDSW0602T is manufactured on UltraCMOS® process, a patented variation of silicon-on-insulator (SOI) technology.

Information contained herein is classified as EAR99 under the U.S. Export Administration Regulations. Export, re-export or diversion contrary to U.S. law is prohibited.

Absolute Maximum Ratings

Exceeding absolute maximum ratings listed in **Table 1** may cause permanent damage. Operation should be restricted to the limits in **Table 2**. Operation between operating range maximum and absolute maximum for extended periods may reduce reliability.

ESD Precautions

When handling this UltraCMOS device, observe the same precautions as with any other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the rating specified in **Table 1**.

Latch-up Immunity

Unlike conventional CMOS devices, UltraCMOS devices are immune to latch-up.

Evaluation Setup

The TDSW0602T s-parameter data and input 1dB compression point up to 60 GHz (**Table 3** and **Figure 3**–**Figure 12**) were taken using either co-planar waveguide with ground (CPWG) or grounded co-planar waveguide (GCPW) on an alumina substrate and RF probes.

The TDSW0602T 2nd harmonic, input 1dB compression point below 18 GHz, input IP3 measurements, settling time and switching time (**Table 3**) were taken on a PCB using 2.92 mm connectors.

Bypass capacitors are not required.
